TITLE: Analysis of cutouts for semiconductor rectifiers

SOURCE: Elektrotechnicky obzor, v. 54, no. 2, 1965, 81-86

TOPIC TAGS: semiconductor rectifier, semiconductor research, electric current

ABSTRACT: The article analyzes the design of cutouts for semiconductor rectifiers. An equation of the arc voltage of the cutout is given for calculation of the limited short-circuit current, and a concrete problem is solved with a computer. Information is presented on calculations of the interruption of the short-circuit current by the cutout in various circuits. This work was presented by J. Kadlec. Orig. art. has: 7 figures, 12 formulas, and 1 table. [JPRS]

Title : The Feeding of the Silver-Black Foxes During Pregnancy.

Orig Pub : Karakulevodstvo i zverovedstvo, 1957, No. 2, 27-29

Abstract : In feeding uniform rations of 625 large calories to silver-black foxes during the entire period of their pregnancy, 4.3 whelps were obtained; when feeding reduced rations (550 large calories) during the first half of the pregnancy and increased rations (700 large calories) during the second half of the pregnancy, the litters averaged 3.3 whelps per fox. It has been noticed that already in the beginning of the pregnancy the organism of the fox is capable of producing reserves of nitrogenous substances which are necessary for

Mekhanizatsiya lit'ya v obolochkovyye formy ( Mechanization of Shell-Mold Casting)  
Moscow, Mashgiz, 1960. 174 p. 6,000 copies printed.

Reviewer: R. I. Ampilogov, Engineer; Ed.: I. B. Pyasik, Engineer;  
Chief Ed. (Southern Division, Mashgiz): V. K. Serdyuk, Engineer; Ed.: P. Ya. Furer.

PURPOSE: This book is intended for technical personnel in foundries.

COVERAGE: The book deals with the large-scale mechanization of the shell-mold casting process in large-lot and mass production. The authors present recommendations for selecting proper materials for the molds and charge, describe what they consider to be the most efficient technique of casting, and discuss equipment required for the operation. Technical and economic indices of shell-mold casting are presented, and measures for safeguarding the health of foundry

TITLE: Intensity of iron saturation in calorizing alloys and methods for refining them

SOURCE: Tekhnologiya i organizatsiya proizvodstva, no. 1, 1966, 43-46

TOPIC TAGS: aluminum containing alloy, metallurgic process, metal purification, binary alloy, temperature test, metal melting, intermetallic compound, iron containing alloy, metallurgy

ABSTRACT: The authors point out that the extent to which aluminum alloys are saturated by iron during calorizing has not been studied up to the present time and little effort has been made to develop methods for purifying these alloys. The problem of refining is important not only from the standpoint of producing binary alloy castings but also for purification of cast aluminum alloys in which iron is a harmful impurity.

Iron saturation was studied for pure aluminum and for aluminum alloys with 7.15 and 28% zinc, as well as in a zinc alloy with 0.2% aluminum since these

UDC: 621.74.043;62.222

Cord 1/4

1916 10 46

L 34186-66

ACC NR: AP6026024

alloys are recommended for use in calorizing. Zinc alloy specimens with 0.2% aluminum were calorized at 535-545°C, aluminum alloys at 680-690 and 720-730°C and pure aluminum at 680-690, 720-730 and 780-790°C. Each specimen was held in the calorizing alloy for five minutes. After every five specimens had been calorized, metal samples weighing 8-10 g were removed from the vat for determining iron concentration. It was found that the specific rate of dissolution and the intensity of iron saturation are increased by raising the calorizing temperature. This is due to an increase in the activity of the melts with respect to iron (the degree of heating and the saturation limit of the iron melt increase.)

The specific rate for dissolving of cast iron in an aluminum alloy with 7% Zn shows the same relationship to iron concentration as for pure aluminum. An increase in temperature from 680-690 to 720-730°C has no effect on specific rate of dissolving. Specific rate of dissolving is increased by raising the zinc content in the melt and at a concentration of 28% the rate is the same as for pure aluminum. However, the relationship between specific rate of dissolving and iron concentration in the calorizing alloy is stronger and differs somewhat from that for pure aluminum.

A sharp reduction in the specific rate of dissolving is observed at iron concentrations below 1.0-1.4% as a function of the calorizing temperature. Beyond this point, there is some increase in the dissolving rate after which it remains practically constant. This type of behavior in the specific rate of dissolving as a function of iron concentration is due to the extreme iron deficiency

Card 2/4

ACC NR: AP6026024

(0.012-0.018%) in the eutectic of the Zn-Fe system and the formation of intermetallic compounds at rather low iron concentrations.

The formation of Fe-Zn and Fe-Al intermetallic compounds (and possibly more complex systems) stabilizes the rate of dissolving. A zinc alloy with 0.2% aluminum yields satisfactory results in calorizing cast iron and steel. Iron saturation of this alloy is much lower than for aluminum or aluminum-zinc alloys. The specific rate of dissolution for iron in this alloy is also very low and increases somewhat with an increase in iron concentration in the alloy. Low iron saturation intensity in a Zn+0.2%Al alloy is due to the low calorizing temperature. Thus, the bath is quite highly saturated with iron during calorizing of steel in aluminum and aluminum alloys.

Two refining methods were tested: settling and filtering. Both methods are based on a reduction in the solubility of iron in aluminum and its alloys when the temperature is reduced. During settling, excess iron which is separated out in the form of aluminides or zincates is precipitated to the bottom of the vat due to its higher specific gravity. In the case of filtering, these iron compounds are retained by the filter for the same reason. Pure aluminum and aluminum-zinc alloy with 28% zinc with various initial iron concentrations were refined. The settling and filtering processes were carried out at a temperature 10-15°C above the solidus temperature. The settling time was four hours. Fusion of the refined alloys with zinc (up to 72% Zn) was used for reducing the

Card 3/4

L 34100-66

ACC NR: AP6026024

solidus temperature. It was found that filtering is an extremely effective refining process and is simpler and less expensive than the settling method. This method is particularly recommended for refining aluminum alloys containing zinc (Al+5-28% Zn and several cast alloys, e.g., AL111, AL114, AL115V, etc.), since the addition of up to 72% zinc to these alloys results in an extremely high purification from iron. TITLE: Structure and phase composition of the diffusion layer in bimetallic iron-aluminum castings

SOURCE: IVUZ. Chernaya metallurgiya, no. 4, 1966, 137-141

TOPIC TAGS: phase composition, binary alloy, iron aluminum alloy

ABSTRACT: The report studies the structure and phase composition of the diffusion layer of specimens of Armco iron (0.014 % C), steel grades 20, 41 and U8 and cast iron grade Sch 21-40, aluminized at different temperatures and aged in a melt of pure aluminum or in an aluminum alloy with 4 % Si and 7 % Zn.

Cylindrical specimens 10 mm in diameter and 30 mm long were aluminized in small tanks of thin sheet iron 25 mm in diameter and 45 mm high which were immersed in a crucible containing the aluminum melt.

Specimens 18 mm in diameter and 70 mm long were aluminized directly in the crucible and then had the aluminum melt poured over them in a sand mold at a temperature of 720-730° C. From the bimetallic billets thus obtained sections and specimens for tensile testing were prepared.

Binary alloys were prepared in an electric arc crucibleless furnace with a protective (argon) atmosphere. Charge materials were Armco iron and AV00 grade aluminum.

Card 1/2

UDC: 669.15'71:621.18

L 39110-66

ACC NR: AP6030381 4

In the aluminizing of Armco iron in pure aluminum, the diffusion layer consisted of two zones: a thick zone of columnar crystallites adjoining the iron, and, considerably thicker, a fine crystalline zone (2-3 microns) adjoining the aluminum. The columnar crystallites grew predominantly in a direction perpendicular to the front of the reactive diffusion (toward the specimen surface) with the formation of characteristic protrusions -- tongues.

Formation of the two-phase layer is the result of reactive diffusion in the solid iron - aluminum melt system: the diffusion of aluminum atoms promotes the growth of columnar crystallites and the overall thickness of the layer, and in the straightforward diffusion of iron, atoms change in the condition of equilibrium of the system which leads to a decrease in layer thickness. From the thermodynamic point of view, this phenomenon boils down to an increase in entropy of displacement and decrease in the free energy of the system and, therefore, proceeds spontaneously and irreversibly.

The results of microstructural and chemical analyses were confirmed by roentgenographic investigation. Orig. art. has: 3 figures. [JPRS: 36,728]

TITLE: Mechanism of plastic deformation in alloys of transition metals 42 39

SOURCE: AN UkrSSR. Mekhanizm plasticheskoy deformatsii metallov (Mechanism of the plastic deformation of metals). Kiev, Naukova dumka, 1965, 29-41 27 B+1

TOPIC TAGS: plastic deformation, cast alloy, phase transition, twinning, material fracture

ABSTRACT: The paper is a continuation of a previous work (Mil'man, Yu. V., Trefilov, V. I., Rachek, A. P., "Problems in the Physics and Science of Metals, 20", Naukova dumka, Kiev, 1964) devoted to the mechanism of plastic deformation and brittle fracture of alloys of elements in group VIA with other transition metals. The following alloy systems are studied: Cr-Mn, Cr-Ru, Cr-Fe, Cr-Os, W-Re, Mo-Re, Nb-Re and Mo-Ti. The alloys were studied in the cast state and in some cases were subjected to heat

Card 1/2 18 2

L 24469-66

ACC NR: AT6010572

3

treatment. The relationship between the packing flaw energy and the electronic structure of the alloy is analyzed. It is shown that both transition and nontransition metals conform to the Seger rule on high energies for packing defects in metals. The twinning ≠ slipping transition in alloys of transition metals is studied. All alloys of elements in group VIA with metals in groups VIIA and VIIIA show a transition to twinning, while alloys with elements in group VIA (Mo-Ti alloys) show no twinning throughout the entire region of solid solutions with a bcc lattice under maximum loads. Experimental data show that alloying chromium, molybdenum and tungsten with metals of groups VIIA and VIII reduces the packing flaw energy and causes a transition to deformation by twinning (or to combined deformation by slipping and twinning). A brief survey of the literature shows no transition to twinning in alloys of group VIA with transition metals to the left of the chromium group in the periodic table. Orig. art. has: 8 figures.

TITLE: Investigation of the effect of highly active elements on the plasticity of chromium

SOURCE: AN UkrSSR. Fizicheskaya priroda khrupkogo razrusheniya metallov (Physical nature of brittle failure of metals). Kiev, Izd-vo Naukova dumka, 1965, 101-111

TOPIC TAGS: chromium, plasticity, metal aging, yttrium, rare earth element

ABSTRACT: The article deals with the refining of chromium by treatment with highly active elements which react with the interstitial impurities in Cr to form more stable compounds than the corresponding Cr compounds. To this end, the use of Y and other rare-earth elements is particularly promising since then it is often possible to improve not only the plasticity but also the high temperature strength of the alloy. However, there is no common consensus on this effect of Y and rare-earth elements. Thus, O. N. Carlson et al. (Less Common Metals, 1964, 6, 6, 439) present experimental findings indicating that the temperature of cold brittle-

Card 1/3

L 41026-66

ACC NR: AT6009600

ness of cast Cr increases when it is treated with Y and other rare-earth elements. To clear up this contradiction, specimens of Cr treated with Y as well as of pure Cr in soldered and evacuated ampoules were annealed at 1200°C for 1 hr and water-quenched. By means of Vickers hardness tests, aging of these specimens was investigated at three temperatures (275°, 350° and 400°C) in a molten-tin bath. The findings on the increase in microhardness with aging are presented in Fig. 1, where each point represents the mean of 8-10 measurements. Fig. 1

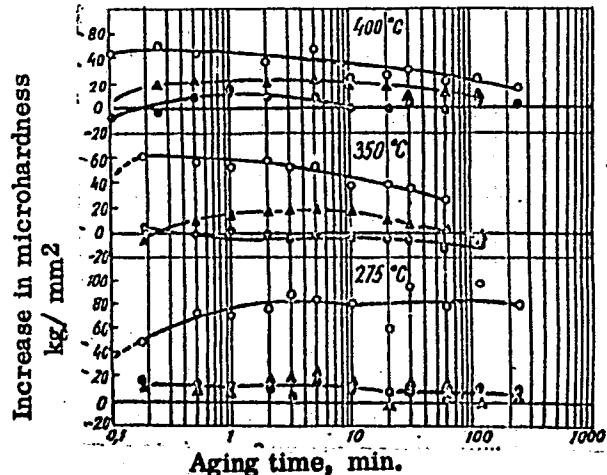

Fig. 1. Effect of treatment with Y and Pr on the aging of Cr:

○ - zone-refined Cr; ● - alloy of Cr + 1% Y; △ - alloy of Cr + 1% Pr

Card 2/3

L 41026-66

ACC NR: AT6009600

indicates that the addition of Y virtually suppresses the processes of aging in the alloy (and hence also it suppresses the rise in the temperature of cold brittleness due to the segregation of an interstitial impurity -- nitrogen -- from the solid solution). These findings confirm the feasibility of using Y to improve the refining of Cr, since Y binds the greater part of nitrogen into nitrides, thus suppressing most of the effects of aging. Further tests, involving the treatment of Cr with microamounts of Y and Pr over a broad temperature range: from the temperature of liquid hydrogen to +900°C, showed that such treatment enhances the microhardness of Cr at elevated temperatures. TITLE: A study of deformation and crack formation in thin chromium foils

SOURCE: Fizika metallov i metallovedeniye, v. 22, no. 4, 1966, 611-616

TOPIC TAGS: chromium, thin film, brittleness, material fracture, electron microscopy, plastic deformation, crystal dislocation, grain structure, CRACK PROPAGATION

ABSTRACT: Electron microscopy was used to study deformation and crack formation in thin chromium foils. The chromium foils were made from ingots which were arc melted in argon. Circular, self-supporting samples were made from discs which were gradually thinned toward the center (thinnest section), and cracks were induced at the center by pricking the disc near the edge. This method allowed various stages of deformation as well as crack formation to be studied. An electron micrograph showed slip traces caused by the intersection of mobile dislocations with the oxide layer formed by electron bombardment. These slip traces were identified with surface interactions. Dislocations accumulated in the slip planes along the boundaries of the foil as a result of retarded motion. Three slip planes were observed: {110}, {112}, and {123}. Aging the foils at room temperature or heating to 350°C in the microscope column did not af-

Card 1/2

UDC: 539.4

ACC NR: AP7005136

flect the microstructures. Electron micrographs were also given of fractured center sections of the sample disc. Both intercrysalline and transcrystalline cracks formed. Cracks along grain boundaries did not result in much plastic deformation in neighboring areas. It was hypothesized that these were caused by dislocations moving at stresses below the elastic limit of the material, accumulating in grain boundaries, and nucleating as cracks at well below the elastic limit. Interactions of transcrystalline cracks with grain boundaries also occurred. Cracks penetrating into the thicker sections of the foil were bent at the point where the crack stopped propagating. This region showed heavy plastic deformation. The slip plane reactions necessary to form cracks (Cottrell mechanism) were outlined by slip traces in the foil which adjoined the crack edges. Slip planes and directions were given for microcrack nucleation in the foils. The microcracks lay along the {112} plane and did not have the orientations necessitated by the Cottrell mechanism. In utilizing these results in foils it is necessary to consider the details of deformation in foils, particularly the stress state and surface effects. Orig. art. has: 5 figures, 1 table, 1 formula.

Experiments in dogs showed that intravenous transfusion may be given much more rapidly than has hitherto been routine, and that it is the addition of sodium citrate to the donor blood which has been the cause of overstrain and heart failure. The rate of transfusion of heparinized blood may be adjusted to the requirements of the organism involved. Further experiments showed that the ill-effects caused by transfusion of citrate blood may be controlled by addition of calcium gluconate and procaine. The rate of transfusion and the effect of sodium citrate and calcium gluconate may be determined by registration of the venous blood pressure, the physiological initial value of which should not be exceeded during transfusion. Findings show that intravenous transfusion may be carried out considerably more swiftly than intra-arterial transfusion, so that the latter would seem to be superfluous.

3012. FIRT P. and HEJHAL L. Inst. of Clin. and Exp. Surg., Prague-Krč. \*Sodium citrate - one of the main causes of cardiac overloading and failure in rapid blood transfusion REV. CZECH. MED., 1955, 1/1 (20-42) Graphs 19 Tables 2

The authors investigated the mechanism of cardiac overloading and failure frequently observed in rapid intravenous transfusions. In experiments on dogs, a rate of transfusion of heparinized blood of 6 ml./kg./min. was given with no ill-effects; however, citrated blood transfusions produced certain haemodynamic disturbances. Small intravenous doses of citrate administered to dogs revealed a marked vasoconstriction in the pulmonary network that produces a strain on the right ventricle. In high concentrations, it weakens cardiac action by direct action on the myocardium. From these experiments it is concluded that it is the sodium citrate and not the blood itself which is the cause of cardiac overloading and failure in rapid intravenous transfusions. Since it is not possible to use heparinized blood in clinical practice, the rapid intravenous transfusion of citrated blood is administered simultaneously with calcium gluconate and procaine. These drugs counteract the unfavourable effect of sodium citrate as reflected by the results of its use clinically for 2 yr.

847. (295) TREATMENT OF SEVERE HAEMORRHAGE - Firt P. and Hejhal  
L. Inst. for Clin. and Exp. Surg., Prague - LANCET 1957, 277006 (1132-  
1137) Graphs 11

Judging from experiments on more than 500 dogs and clinical trials extending over 3 yr., failures are of 3 kinds. In the largest group the rate and amount of blood transfused were insufficient. In a smaller group the amount and rate seem sufficient but the patient deteriorates with continuing transfusions. Most of these failures are a result of the grave initial state of the patient - particularly severe shock and irreversible changes. In the smallest group the rate and amount of transfused blood, otherwise corresponding to the patient's needs, induce cardiac failure. Recognition of the 3rd group led to great caution in giving rapid transfusions. Overloading and failure of the heart during rapid transfusions is not a function of transfusion per se but of the amount of citrate given. Even in small doses citrate produces vasoconstriction in the pulmonary vascular bed, and in larger doses depresses myocardial activity, both effects leading to cardiac overloading and failure. The effect of citrate during transfusion can be safely counteracted by the simultaneous i.v. administration of calcium and procaine. Bruusgaard - Oslo (IX, 19)

AUTHOR: Firt, Vladimír, Engineer

TITLE: The calculation of ordinate values by the transformation of a homogeneous system of algebraic equations

PERIODICAL: Aplikace matematiky, v. 6, no. 2, 1961, 91-99

TEXT: For investigating the limiting stresses of building structures and for calculating auto-vibrational frequencies of systems in unstressed conditions, as well as of systems under static axial stresses, the most frequently employed methods include the deformational and vectorial ones and the integration of differential equations, Ritz's and Galerkin's methods. In these methods one encounters the problem of evaluating the ordinate value  $\xi_0$  of a homogenous system of n algebraic equations, which are linear relative to the unknown  $x_i$  at  $i = 1, 2, \dots, n$ . Such a homogenous system is presented under

$$a_{1,1}x_1 + a_{1,2}x_2 + \dots + a_{1,n-1}x_{n-1} + a_{1,n}x_n = 0,$$
$$a_{2,1}x_1 + a_{2,2}x_2 + \dots + a_{2,n-1}x_{n-1} + a_{2,n}x_n = 0,$$

.....

Card 1/9

The calculation of ordinate values...

Z/026/61/008/002/001/004  
D231/D304

$$a_{n-1,1}x_1 + a_{n-1,2}x_2 + \dots + a_{n-1,n-1}x_{n-1} + a_{n-1,n}x_n = 0, \quad (1)$$
$$a_{n,1}x_1 + a_{n,2}x_2 + \dots + a_{n,n-1}x_{n-1} + a_{n,n}x_n = 0.$$

and functions of the argument  $\varepsilon$  are given by the coefficients  $a_{i,k} = f_{i,k}(\varepsilon)$ . The ordinate value  $\varepsilon_o$  is governed by condition

$$\Delta(\varepsilon_o) = 0, \quad (2)$$

where the determinant  $\Delta(\varepsilon)$  has the form of

$$\Delta(\varepsilon) = \begin{vmatrix} a_{1,1}, a_{1,2}, \dots, a_{1,n} \\ a_{2,1}, a_{2,2}, \dots, a_{2,n} \\ \vdots \quad \vdots \quad \vdots \\ a_{n,1}, a_{n,2}, \dots, a_{n,n} \end{vmatrix} \quad (3) \quad X$$

It is intended to facilitate the evaluation of the ordinate value  $\varepsilon_o$  from Eq. (2), which becomes too involved when determinant (3) is of a high order. To do this, it is proposed transforming the homogenous system of equations into a non-homogenous one and apply-

Card 2/9

26318  
Z/026/61/006/002/001/004  
D231/D304

The calculation of ordinate values...

ing the iterative method by proceeding in stages of approximations. The main advantage in this procedure is that it dispenses with the plotting of the function  $\Delta(\varepsilon)$  in a graph for interpolation. The proposed method divides each of the system (1) equations by  $x_n \neq 0$ , thus obtaining the non-homogenous system

$$a_{1,1} \frac{x_1}{x_n} + a_{1,2} \frac{x_2}{x_n} + \dots + a_{1,n-1} \frac{x_{n-1}}{x_n} = - a_{1,n}, \quad (5)$$

$$a_{2,1} \frac{x_1}{x_n} + a_{2,2} \frac{x_2}{x_n} + \dots + a_{2,n-1} \frac{x_{n-1}}{x_n} = - a_{2,n},$$

.....

$$a_{n-1,1} \frac{x_1}{x_n} + a_{n-1,2} \frac{x_2}{x_n} + \dots + a_{n-1,n-1} \frac{x_{n-1}}{x_n} = - a_{n-1,n}.$$

and

$$a_{n,1} \frac{x_1}{x_n} + a_{n,2} \frac{x_2}{x_n} + \dots + a_{n,n-1} \frac{x_{n-1}}{x_n} + a_{n,n} = 0. \quad (6)$$

In the first approximation an arbitrary value ( $\alpha$ ) is taken for

Card 3/9

26318

Z/026/61/006/002/001/004  
D231/D304

The calculation of ordinate values...

the ordinate value  $\xi_0$  of the nought order and the values of the coefficients  $(o)a_{i,k} = f_{i,k}$   $(o)\xi$  are calculated. By Gaussian elimination, by iteration or by some other method, the ratios

$(o)\left(\frac{x_i}{x_n}\right)$  at  $i = 1, 2, \dots, n - 1$  are evaluated from the identities

in (5), and these ratios are approximate because they were derived from the approximate values  $(o)a_{i,k}$ . The values  $(o)a_{n,k} = f_{n,k}$

$(o)\xi$  and  $(o)\left(\frac{x_i}{x_n}\right)$  are inserted into Eq. (6) and the function

$$(1) \Phi(\xi) = (o)\left(\frac{x_1}{x_n}\right)a_{n,1} + (o)\left(\frac{x_2}{x_n}\right)a_{n,2} + \dots + (o)\left(\frac{x_{n-1}}{x_n}\right) \\ a_{n,n-1} + a_{n,n} \quad (7)$$

thus obtained is plotted in a graph, where  $(o)\left(\frac{x_i}{x_n}\right)$  are constants

Card 4/9

26318

Z/026/61/006/002/001/004

D231/D304

The calculation of ordinate values...

and only the coefficients  $a_{n,k}$  are functions of the argument  $\epsilon$ . Approximation  $(1)\epsilon$  is the root of the equation  $(1)\Phi(\epsilon) = 0$ . Similarly, for the second approximation the values of the coefficients  $(1)a_{i,k} = f_{i,k}((1)\epsilon)$  are calculated and then the ratios  $\frac{x_i}{x_n}$

at  $i = 1, 2, \dots, n-1$  are established by solving Eq. (5) with these coefficients  $(1)a_{i,k}$ . The graph of function

$$(2)\Phi(\epsilon) = (1)\left(\frac{x_1}{x_n}\right)a_{n,1} + (1)\left(\frac{x_2}{x_n}\right)a_{n,2} + \dots + (1)\frac{x_{n-1}}{x_n} \\ a_{n,n-1} + a_{n,n}, \quad (8)$$

is then plotted with the constant ratios  $(1)\left(\frac{x_i}{x_n}\right)$  and with the coefficients  $a_{n,k}$  which are functions of the argument  $\epsilon$ . The root of equation  $(2)\Phi(\epsilon) = 0$ , namely  $(2)\epsilon$ , is the second approximation of the ordinate value  $\epsilon_0$ . Generally, the value  $(m)\epsilon$  will be a

Card 5/9

26318

Z/026/61/006/002/001/004

D231/D304

The calculation of ordinate values...

sufficiently close approximation of  $\varepsilon_0$  if its difference from the preceding value  $(m-1) \varepsilon$  is "sufficiently small". Two numerical examples demonstrate the application of this method for calculating the minimum value of the limiting stress range of a frame (Fig. 1a), pertaining in the first example to the shape of deflection which is defined by the relative displacement  $\delta$  of the cross-sections of pillar heads (Fig. 1b); in the second example the same frame is restrained in position by struts (Fig. 1c). In both cases the moment of pillar inertia, the length of struts, the height of frame and the ratios of stresses  $N_i, kr$  are given. In the first example the homogenous system

$$\begin{aligned}
 [L_1(\varepsilon_1) + 4k]\phi_1 &+ 2k\phi_2 - L_3(\varepsilon_1)\psi = 0, \\
 2k\phi_1 + [L_1(\varepsilon_2) + 8k]\phi_2 &+ 2k\phi_3 - L_3(\varepsilon_2)\psi = 0, \\

 \end{aligned}$$

and both approximations are evaluated numerically, the second approximation also graphically (Fig. 2). In the second example one approximation suffices. It is generally concluded that identity (6) can be chosen deliberately from Eq. (1) and, provided that the ratios  $x_i/x_n$  are known accurately,  $\varepsilon_o$  can be computed from any of the system (5) or (6) equations. Taking the numerical examples, the most convenient form of Eq. (6) to be chosen out of the system (1) equations would be one, the right hand side of which represents a stress condition with constructional deformations similar to the

AUTHOR: Firt, Vladimir, Engineer

TITLE: Contribution to determining characteristic roots

PERIODICAL: Aplikace matematiky, v. 7, no. 1, 1962, 51-73

TEXT: The article describes four methods for determining characteristic roots based on the transformation of the homogeneous system of algebraic (linear) equations

$$\begin{aligned} a_{1,1}x_1 + a_{1,2}x_2 + \dots + a_{1,n-1}x_{n-1} + a_{1,n}x_n &= 0, \\ a_{2,1}x_1 + a_{2,2}x_2 + \dots + a_{2,n-1}x_{n-1} + a_{2,n}x_n &= 0, \\ \dots &\dots \\ a_{n-1,1}x_1 + a_{n-1,2}x_2 + \dots + a_{n-1,n-1}x_{n-1} + a_{n-1,n}x_n &= 0, \\ a_{n,1}x_1 + a_{n,2}x_2 + \dots + a_{n,n-1}x_{n-1} + a_{n,n}x_n &= 0, \end{aligned}$$

Contribution to determining ...

The first method is used for determination of the characteristic frequencies of a framework (Fig. 1). The root  $\lambda_0$  is obtained as the root of the equation  $A(\lambda) = 0$ , the function  $A(\lambda)$  being defined by

$$A(\lambda) = a_{n,1} \frac{x_1}{x_n} + a_{n,2} \frac{x_2}{x_n} + \dots + a_{n,n-1} \frac{x_{n-1}}{x_n} + a_{n,n} \quad (7)$$

and the values of

$$a_{1,1} \frac{x_1}{x_n} + a_{1,2} \frac{x_2}{x_n} + \dots + a_{1,n-1} \frac{x_{n-1}}{x_n} = -a_{1,n},$$

$$a_{2,1} \frac{x_1}{x_n} + a_{2,2} \frac{x_2}{x_n} + \dots + a_{2,n-1} \frac{x_{n-1}}{x_n} = -a_{2,n},$$

$$\dots$$

$$a_{n-1,1} \frac{x_1}{x_n} + a_{n-1,2} \frac{x_2}{x_n} + \dots + a_{n-1,n-1} \frac{x_{n-1}}{x_n} = -a_{n-1,n}. \quad (8)$$

are used instead of  $x_1/x_n$ ,  $i = 1, 2, \dots, n-1$ . In the special case shown in

$$\begin{aligned} a_{1,1}x_1 + a_{1,2}x_2 &= 0, \\ a_{2,1}x_1 + a_{2,2}x_2 + a_{2,3}x_3 &= 0, \\ \dots &\dots \\ a_{n-2,1} + a_{n-2,2}x_2 + \dots + a_{n-2,n-1}x_{n-1} &= 0, \\ a_{n-1,1}x_1 + a_{n-1,2}x_2 + \dots + a_{n-1,n-1}x_{n-1} + a_{n-1,n}x_n &= 0, \\ a_{n,1}x_1 + a_{n,2}x_2 + \dots + a_{n,n-1}x_{n-1} + a_{n,n}x_n &= 0. \end{aligned}$$

(12) *[Handwritten mark]*

the function  $A_1(\lambda)$  is determined by

$$A_1(\lambda) = a_{n,1} + a_{n,2} \frac{x_2}{x_1} + a_{n,3} \frac{x_3}{x_1} + \dots + a_{n,n} \frac{x_n}{x_1} \quad (14)$$

D236/D305

Contribution to determining ...

and it is advantageous to use the equation  $A_1(\lambda) = 0$ . The remaining methods are all iterative. Method two is the method of normal iteration; it is based on the auxiliary system of (12), the solution of

$$\begin{aligned}
 a_{1,2} \frac{x_2}{x_1} &= -a_{1,1}, \\
 a_{2,2} \frac{x_2}{x_1} + a_{2,3} \frac{x_3}{x_1} &= -a_{2,1}, \\
 a_{3,2} \frac{x_2}{x_1} + a_{3,3} \frac{x_3}{x_1} + a_{3,4} \frac{x_4}{x_1} &= -a_{3,1}, \\
 \dots & \\
 a_{n-2,2} \frac{x_2}{x_1} + a_{n-2,3} \frac{x_3}{x_1} + \dots + a_{n-2,n-1} \frac{x_{n-1}}{x_1} &= -a_{n-2,1}, \\
 a_{n-1,2} \frac{x_2}{x_1} + a_{n-1,3} \frac{x_3}{x_1} + \dots + a_{n-1,n-1} \frac{x_{n-1}}{x_1} + a_{n-1,n} \frac{x_n}{x_1} &= -a_{n-1,1}. \tag{13}
 \end{aligned}$$

The third system, the system of double iteration, is based on previous work by the author (Ref. 1: Aplikace matematiky, no. 2, 1961) and is actually a combination of the method of the normal iteration and the cited work by the author. The last method, that of treble iteration, is also based on the author's previous work, forming approximations of approximations for the characteristic roots. Numerical examples are given. The conditions of convergence of the methods are not examined. Exact and appropriate calculation of the first derivative of function (7) is given; four approximate equations for this function in the neighborhood of point  $\lambda^{(k)}$  are also given. There are 3 figures, 1 table and 9 references: 8 Soviet-bloc and 1 non-Soviet-bloc.

TITLE : Clinical Data on the Treatment of 121 Cases of  
tumors of the Lip

ORIG. PUB. : Stomatologia, 1956, Vol.3, No.1, 28-39

ABSTRACT : The authors' material - 121 cases of tumors of  
the lip - included 97 involving the lower lip  
(80.56%) and 24 the upper lip (16.52%). Malignant  
tumors predominated (72.0%). Of these, 50 were  
in the second stage (45 cases), 24 in the third  
and fourth, and only 5 in the first stage. Treat-  
ment was primarily surgical. The second step in  
therapy - removal of regional lymph nodes - was  
reported to only when the latter were palpable.  
Long-term results in the first two stages were  
good. Some patients were followed up to 15 years.  
In stages III and IV, recurrence was seen in 5 of  
3 cases (from 6 months to 2 years) even with wide-  
spread resection of nodes. -- P.I.Simulevich
